# Factsheet

CoDe Academy 2016

What

Continuous Delivery Academy 2016 is the first year of the privately funded training bootcamp for IT-students about to graduate. The alumni will master central Continuous Delivery tools for software build, like Git, Docker, and Jenkins.

When

During summer, when the students don't have other classes and the universities can provide auditorium space.

Where

Class of 2016 can either graduate from Trondheim, Copenhagen, Aarhus, or Oslo.

Who

Eligible for free enrollment are students and recent graduates of computer science, at universities or business colleges.

Why

Organisations all over the world are looking for candidates that are prepared to work in modern, agile teams and deliver software continuously. Consulting house Praqma already trains their own employees as well as their customers in the modern toolstack of Git, Docker, and Jenkins. And since demand continues to be intense for these skills, they decided to expand the training to 400 Scandinavian graduates.

How

Organisations that are looking for the perfect candidates for their software development teams have generously sponsored the funds to run the four academies of 2016. They are investing in a new generation of graduates that are not only well versed in their theoretical curriculum, but have hands-on experience with the tools to plan, build, ship and run the software of tomorrow.

The Academy is coordinated by the Praqma team
